

When purchasing a garden building it is important to know some of the important details that will ensure that the building will fulfill your requirements, give you value for money and will last.

Buying from a catalogue or from the internet can be risky especially if the manufacturer does not give you the opportunity to view their products.

To help we have outlined a number of key points to watch out for when choosing a garden building.

Titan buildings meet all these recommendations and you can view and purchase them at show sites all over the South of England.

- The price quoted should include the floor, the glass, treatment, delivery and VAT.
- The building should receive full immersion timber treatment. This provides total panel protection and ensures that the whole panel is treated - not just the parts that can be seen.
- For a lasting building it should be manufactured using Redwood in all the exposed areas rather than the less durable Whitewood.
- Shiplap and Loglap finishes should be tongue and grooved not just overlapped.
- Featheredge cladding should have a generous overlap to eliminate warping. It is also worth checking the thickness of the timber cladding. Too thin and the building will soon be showing signs of wear. (see picture)
- Are you being offered the exact size of building that you want for your site, or do have to compromise? We know that your requirements might not always be straight forward so we offer a service that is tailored to your needs.
- With Titan you can have the door and windows where you need them at no extra cost. (note: this excludes the Budget Range)
- All good building will be covered by a comprehensive 12 month guarantee.
- Are your contents secure in the building? The doors should have positive seating and security bolts just as Titan's do, and the doors should also be ledged and braced for added strength.
- The fittings and fixings should all be high quality and rust proof.
- What is the height of the building? Are you comfortable standing and working in the building. Some manufacturers cut costs by reducing the overall height. At Titan not only do we provide generous headroom, but we can increase it to your specification. This is important if you have tall objects to store or are particularly tall yourself.
- Chipboard, OSB board, particle board and Sterling board should not be used. These materials are really not suitable for outdoor use.
- One final point, its worth looking at the manufacturer's background. How long have they been in business? Do they subcontract all or part of their manufacturing and installation? Do they have effective quality control?
